

Cobb EMC • Marietta, GA

Cobb EMC selected the CriticalSpace Solutions team to design, build, install, integrate, and maintain an upgraded control room display capability. The facility's new display wall uses Barco 80-inch Digital Light Processing (DLP) cubes and a Barco Argus processor running UNIX. The processor has the power to manage current and projected workloads, eliminating the problems created when the old processors failed and brought down the system. The DLP cubes' color-matching capability makes it easy for personnel to see

outage locations, facilitating dispatch of technicians to repair and restore power. CriticalSpace Solutions is now integrating a second display-wall controller for Cobb EMC to use during crisis mode.
